

# Programming Language Systems

**Instructors:** Taiichi Yuasa and Masahiro Yasugi

## Course Description (overview, purpose):

The course provides an introduction to run-time mechanisms such as memory allocation, garbage collection, virtual machines, code generation, and exception handling that are required to implement programming language processors.

## Course Schedule:

The following topics are covered, each in two to four lectures.

1. JVM execution model: The execution model of the virtual machine JVM is introduced together with actual Java systems.
2. JVM instruction set: Selected instructions of JVM are explained with their relation to Java code and to the execution model.
3. Translation to JVM: Compilation techniques for translating Java programs to JVM code sequences are presented.
4. Garbage collection: Various methods are introduced for garbage collection which is inevitable for program execution.
5. Optimization: Various techniques are introduced for optimization at compile time, at load time, and at run time.

## Prerequisites and Course Requirements:

Students are expected to have some prior knowledge of programming languages, compilers, and computer architecture.

## Grading Methods and Evaluation Criteria :

Students are required to submit reports on some subjects that will be given during lectures.

These reports are used to judge how much each student has mastered the structure and implementation of programming language systems.

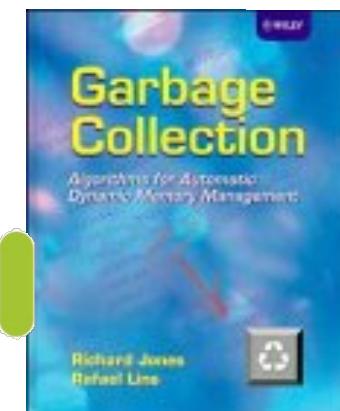

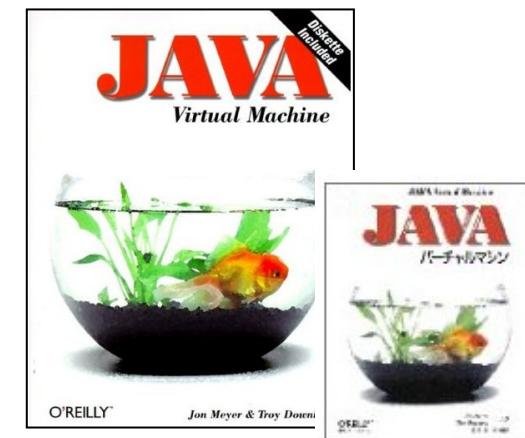

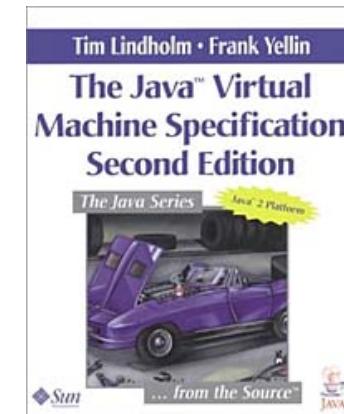

**Textbooks:** N/A

- Richard Jones and Rafael Lins: Garbage Collection (Wiley).

## Miscellaneous :

Course materials can be downloaded from the course web page that will be announced during the first lecture.

# Programming Languages, Adv.

**Instructors:** Masahiro Yasugi and Taiichi Yuasa

**Course Description (overview, purpose):**

The course covers programming language topics such as syntax and semantics, functionality and its implementation, the object-oriented paradigm, type systems, and language features for concurrency and exception

**Course Schedule:**

1. Programming languages and virtual machines (2 or 3 lectures): The first part of this course explains programming languages and virtual machines, interpreters, and translators.
2. The object-oriented paradigm and a brief introduction to Java (2 or 3 lectures): The second part of this course explains the object-oriented paradigm and a brief introduction to Java.
3. The object-oriented paradigm and type systems (4 or 5 lectures): The third part of this course explains class inheritance, overloading, late binding, multiple inheritance, delegation, abstract classes, interfaces, and subtyping.
4. Various language features (4 or 5 lectures): The fourth part of this course explains exception handling, concurrency (multi-threading), generics, and interaction with garbage collectors (finalization and weak references).

**Prerequisites and Course Requirements:**

Students are expected to have some prior knowledge of programming languages, including the C programming language.

**Grading Methods and Evaluation Criteria:**

The evaluation is based on submitted reports and an examination. The goal of the course is to acquire the ability to understand and think the design of language specifications.

**Textbooks:** N/A

#### Operand stack

Operand
Operand

Relationship between Java stack and operand stack

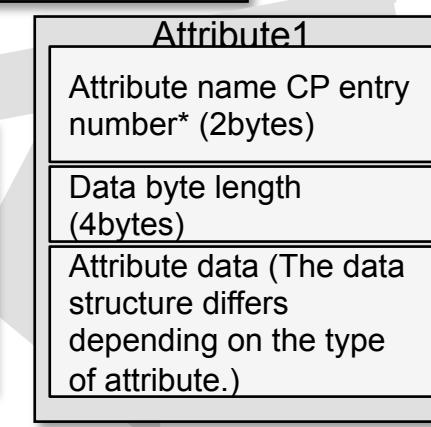

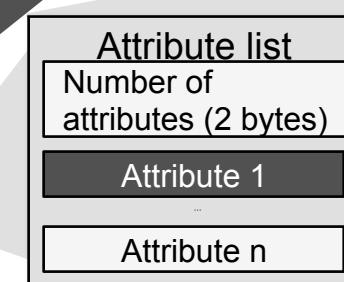

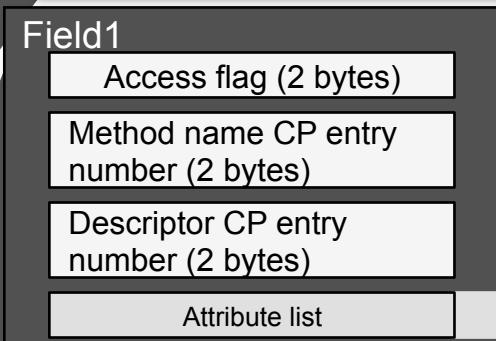

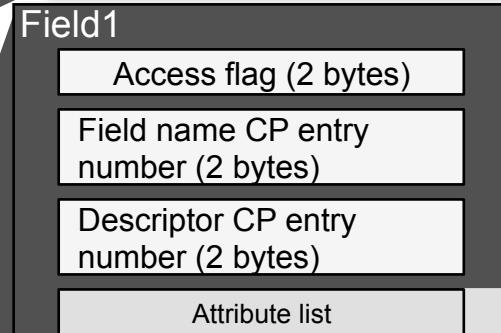

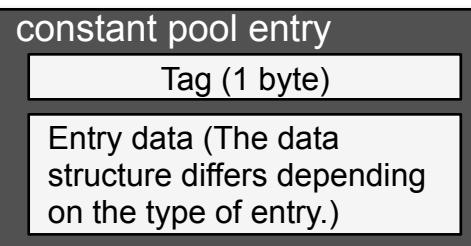

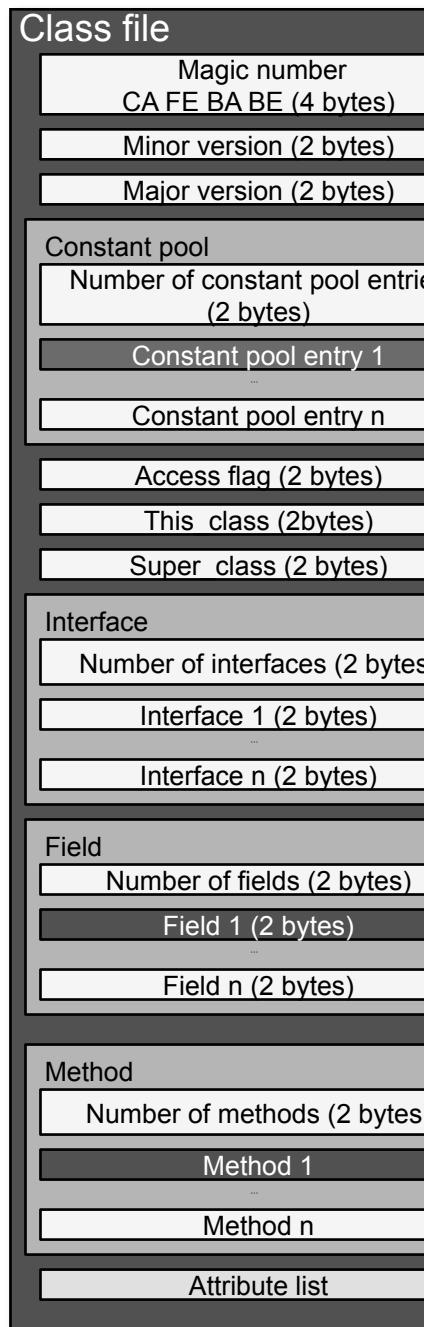

States of operand stack before and after execution of iadd

Executing iload 3

\*CP entry number = constant pool entry number

Assembler statement

getstatic java/lang/System/out Ljava/io/PrintStream; is  
converted into a byte code of 'B2 00 07.'

Instruction code  
getstatic

Tag '07' means CONSTANT\_Class  
(class reference).

Constant pool entry number  
for field reference of operand

B2 00 07

5th constant pool entry  
07 00 1C

7th constant pool entry  
09 00 05 00 0A

Tag '09' means CONSTANT\_Fieldref  
(field reference).

10th constant pool entry  
0C 00 1E 00 17

Tag '0C' means  
CONSTANT\_NameAndType.

23rd constant pool entry  
01 00 15

"Ljava/io/PrintStream;"

Number of bytes

28th constant pool entry  
01 00 1C

"Ljava/lang/System"

Number of bytes

Tag '01' means CONSTANT\_Utf8  
(class reference).

30th constant pool entry  
01 00 1C

"out"

Number of bytes

Constant pool referenced by getstatic

# Instruction Set

Load constant

bipush Push byte

sipush Push short

ldc Push item from runtime constant pool (single-byte index)

ldc\_w Push item from runtime constant pool (wide index)

ldc2\_w Push long or double from runtime constant pool (wide index)

aconst\_null Push null

iconst\_<i> Push int constant (<i> : m1,0,1,2,3,4,5)

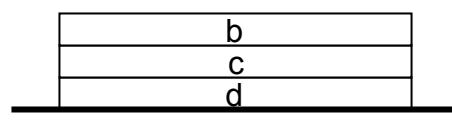

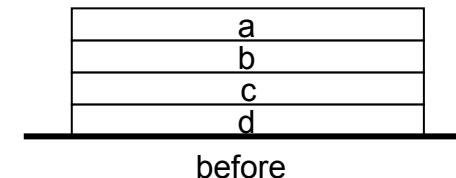

lconst\_<l> Push long constant (<l> : 0,1)

fconst\_<f> Push float constant (<f> : 0,1,2)

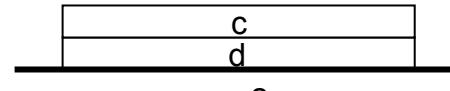

dconst\_<d> Push double constant (<d> : 0,1)

## Pop

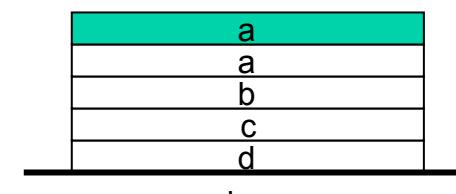

pop	Pop the top op-stack value
pop2	Pop the top two op-stack values
dup	Duplicate the top op-stack value
dup2	Duplicate the top two op-stack values
dup_x1	Duplicate the top op-stack value and insert two values down
dup_x2	Duplicate the top op-stack value and insert three values down
dup2_x1	Duplicate the top two op-stack values and insert three values down
dup2_x2	Duplicate the top two op-stack values and insert four values down
swap	Swap the top two op-stack values

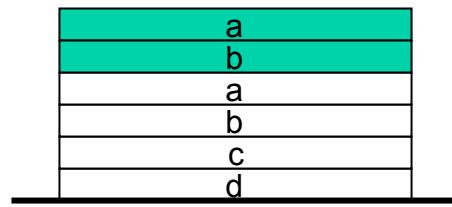

pop

## Load from local variable

iload	Load int from local variable
iload_<n>	Load int from local variable (<n> = 0,1,2,3)
lload	Load long from local variable
lload_<n>	Load long from local variable (<n> = 0,1,2,3)
fload	Load float from local variable
fload_<n>	Load float from local variable (<n> = 0,1,2,3)
dload	Load double from local variable
dload_<n>	Load double from local variable (<n> = 0,1,2,3)
aload	Load reference from local variable
aload_<n>	Load reference from local variable (<n> = 0,1,2,3)

Variables 0~255

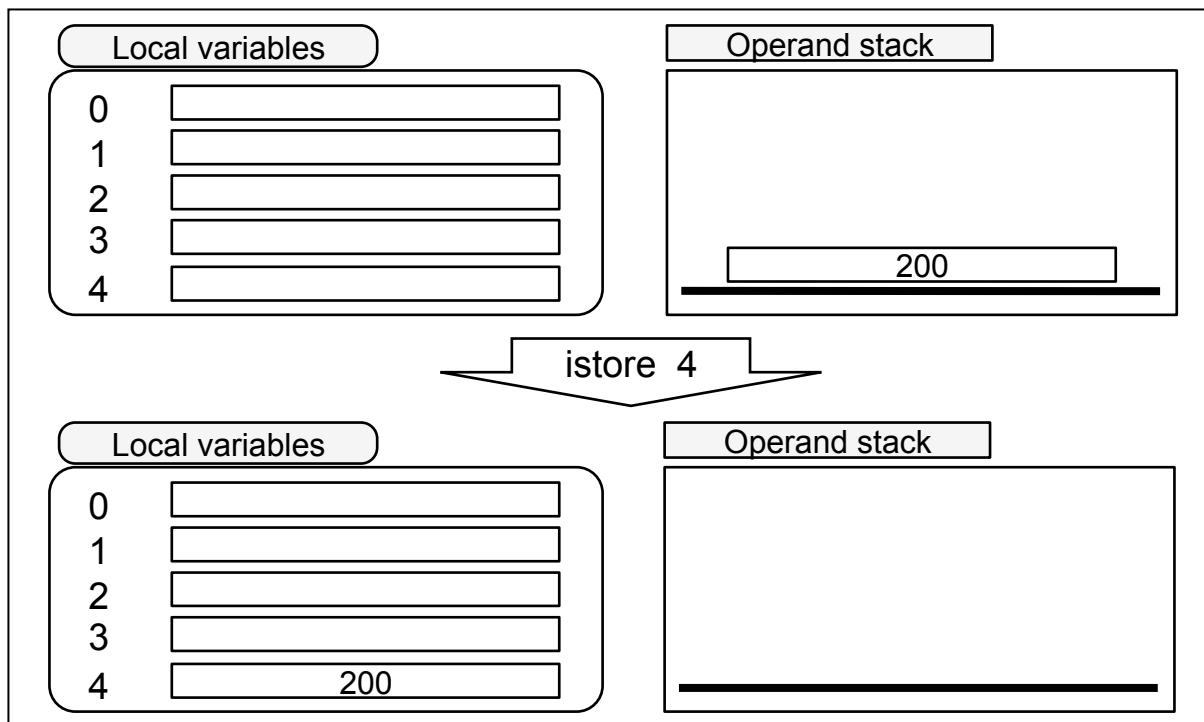

Variables 256~

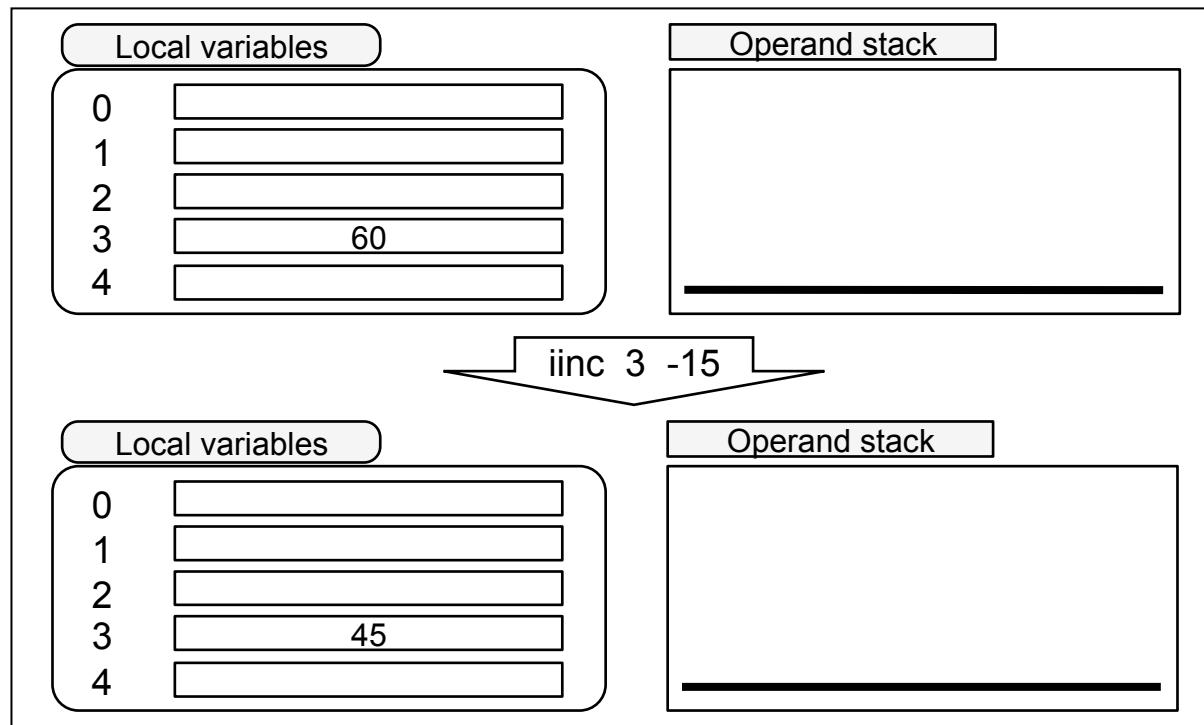

## Store into local variable

istore        Store int into local variable  
istore\_<n>    Store int into local variable (<n> = 0,1,2,3)  
lstore        Store long into local variable  
lstore\_<n>    Store long into local variable (<n> = 0,1,2,3)  
fstore        Store float into local variable  
fstore\_<n>    Store float into local variable (<n> = 0,1,2,3)  
dstore        Store double into local variable  
dstore\_<n>    Store double into local variable (<n> = 0,1,2,3)  
astore        Store reference into local variable  
astore\_<n>    Store reference into local variable (<n> = 0,1,2,3)

## Increment

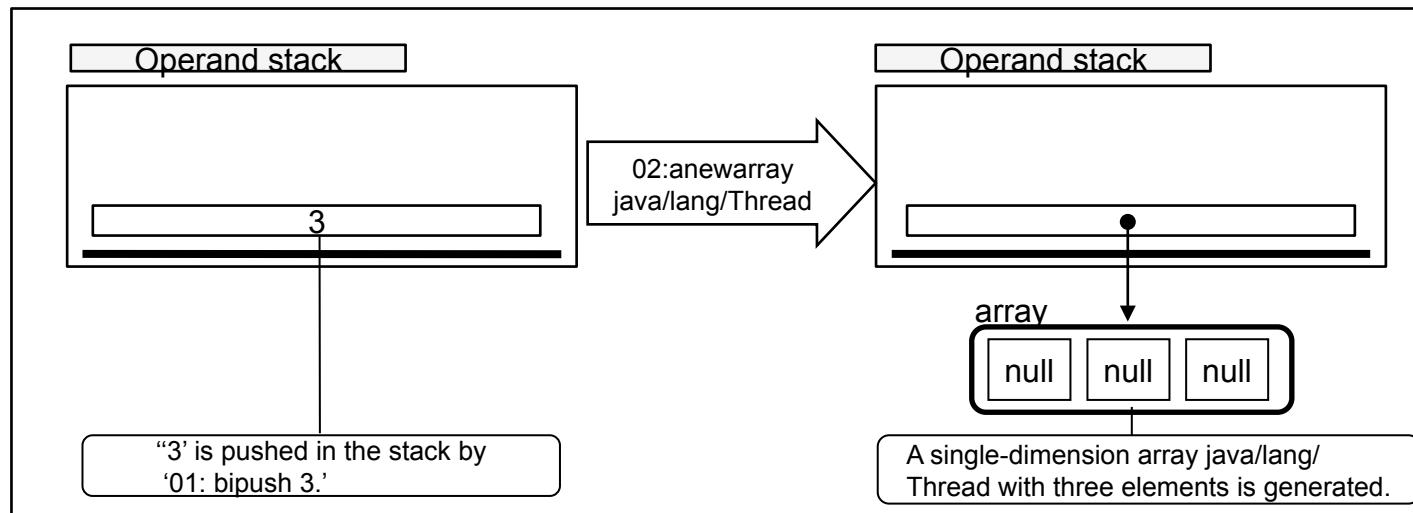

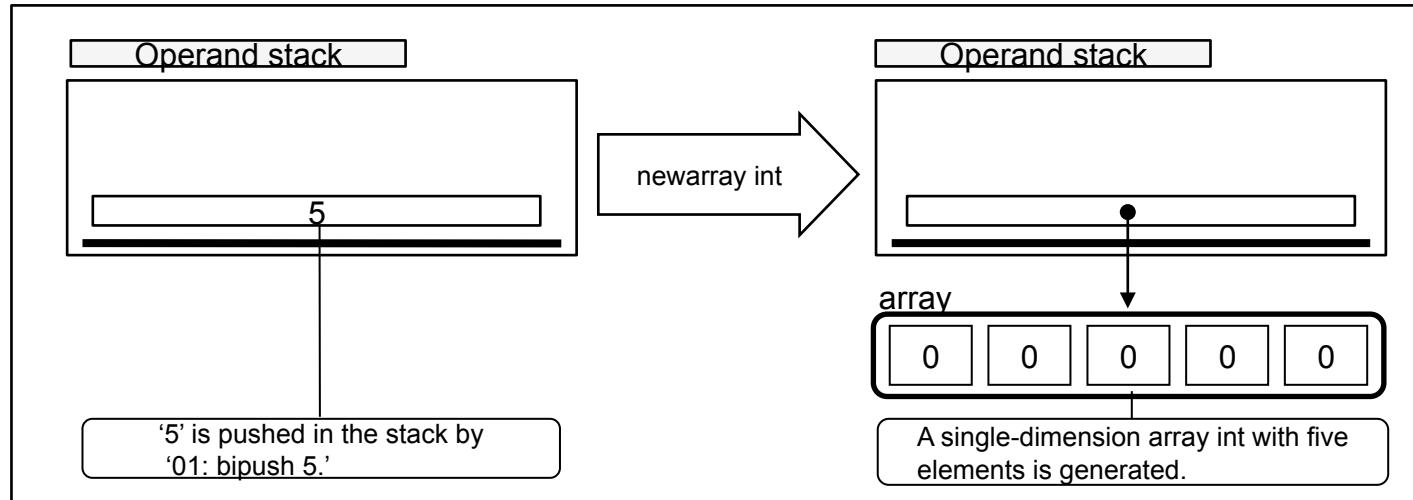

iinc Increment local variable by constant

## Create array

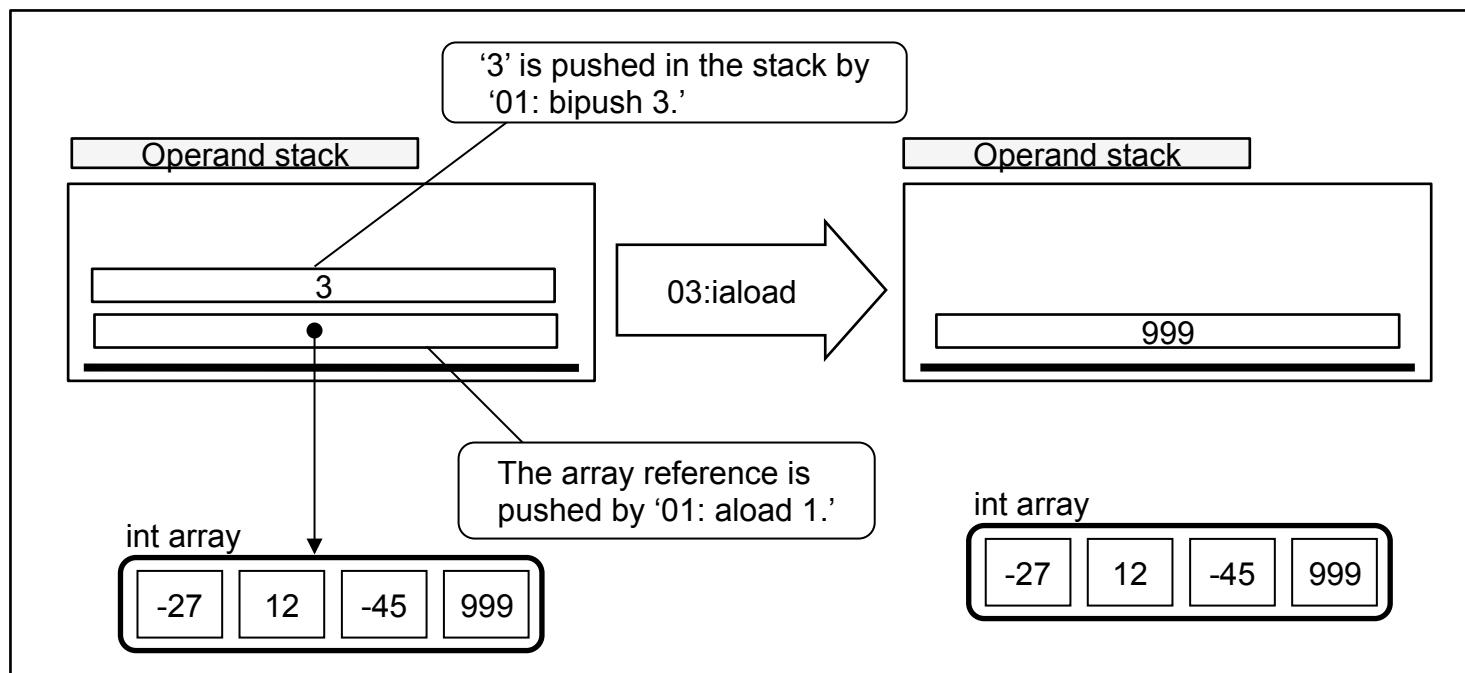

newarray Create new array of basic type  
anewarray Create new array of reference  
multianewarray Create new multidimensional array

arraylength Get length of array

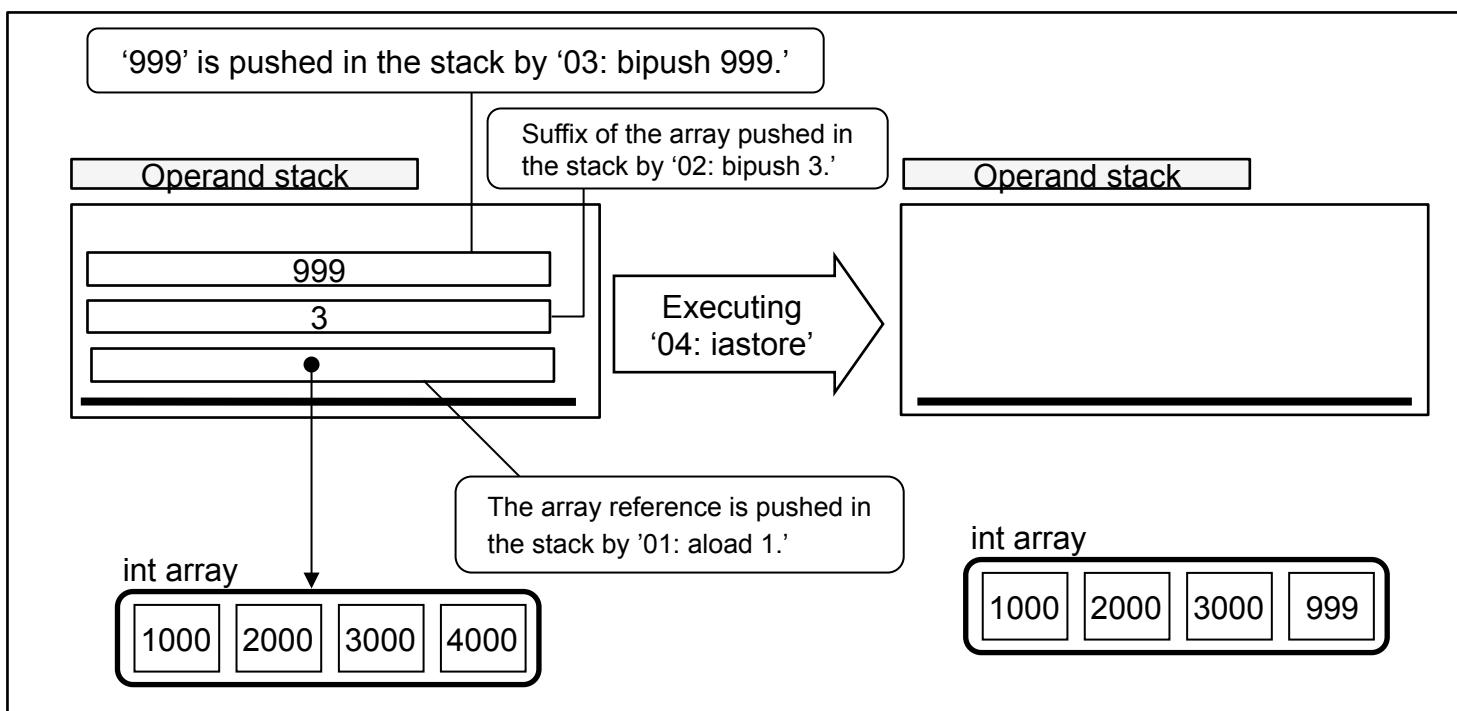

## Load from Array

baload Load byte or boolean from array  
caload Load char from array  
saload Load short from array  
iaload Load int from array  
laload Load long from array  
faload Load float from array  
daload Load double from array  
aaload Load reference from array

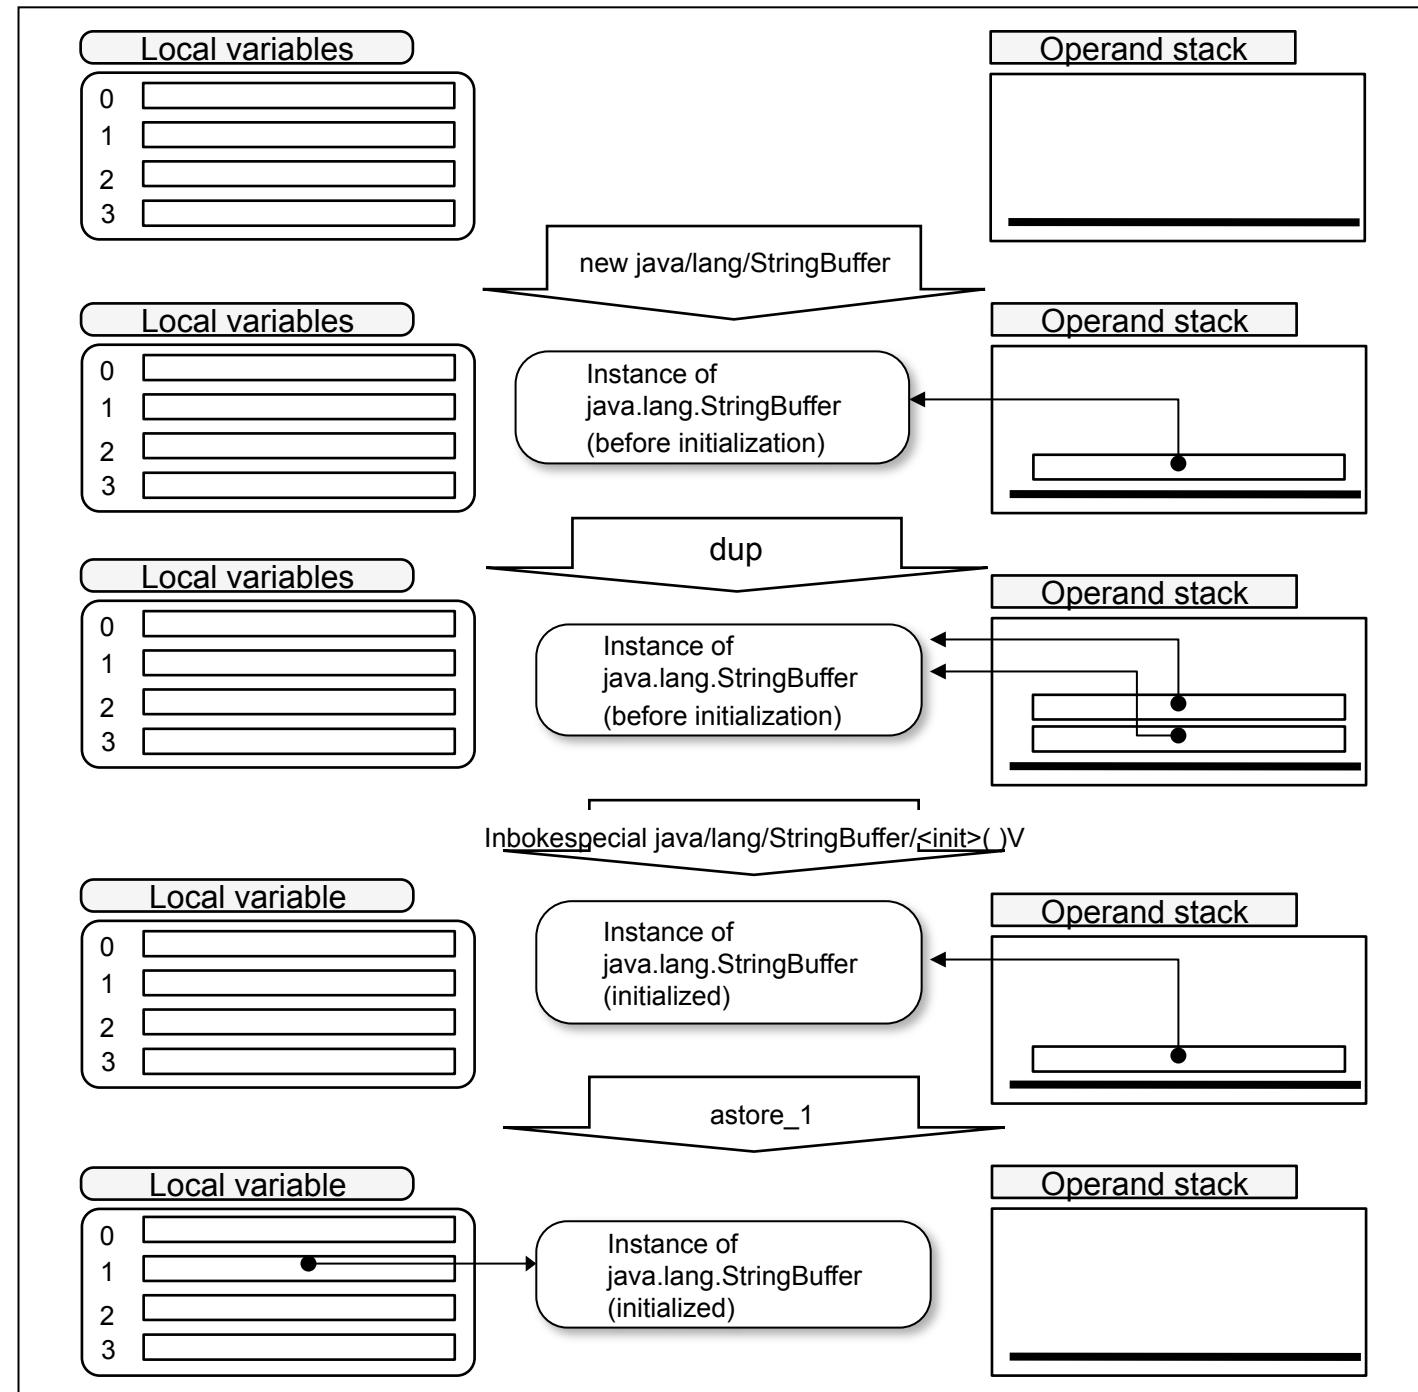

## Store into array

bastore	Store into byte or boolean array
castore	Store into char array
sastore	Store into short array
iastore	Store into int array
lastore	Store into long array
fastore	Store into float array
dastore	Store into double array
aastore	Store into reference array

Create new object

new Create new object

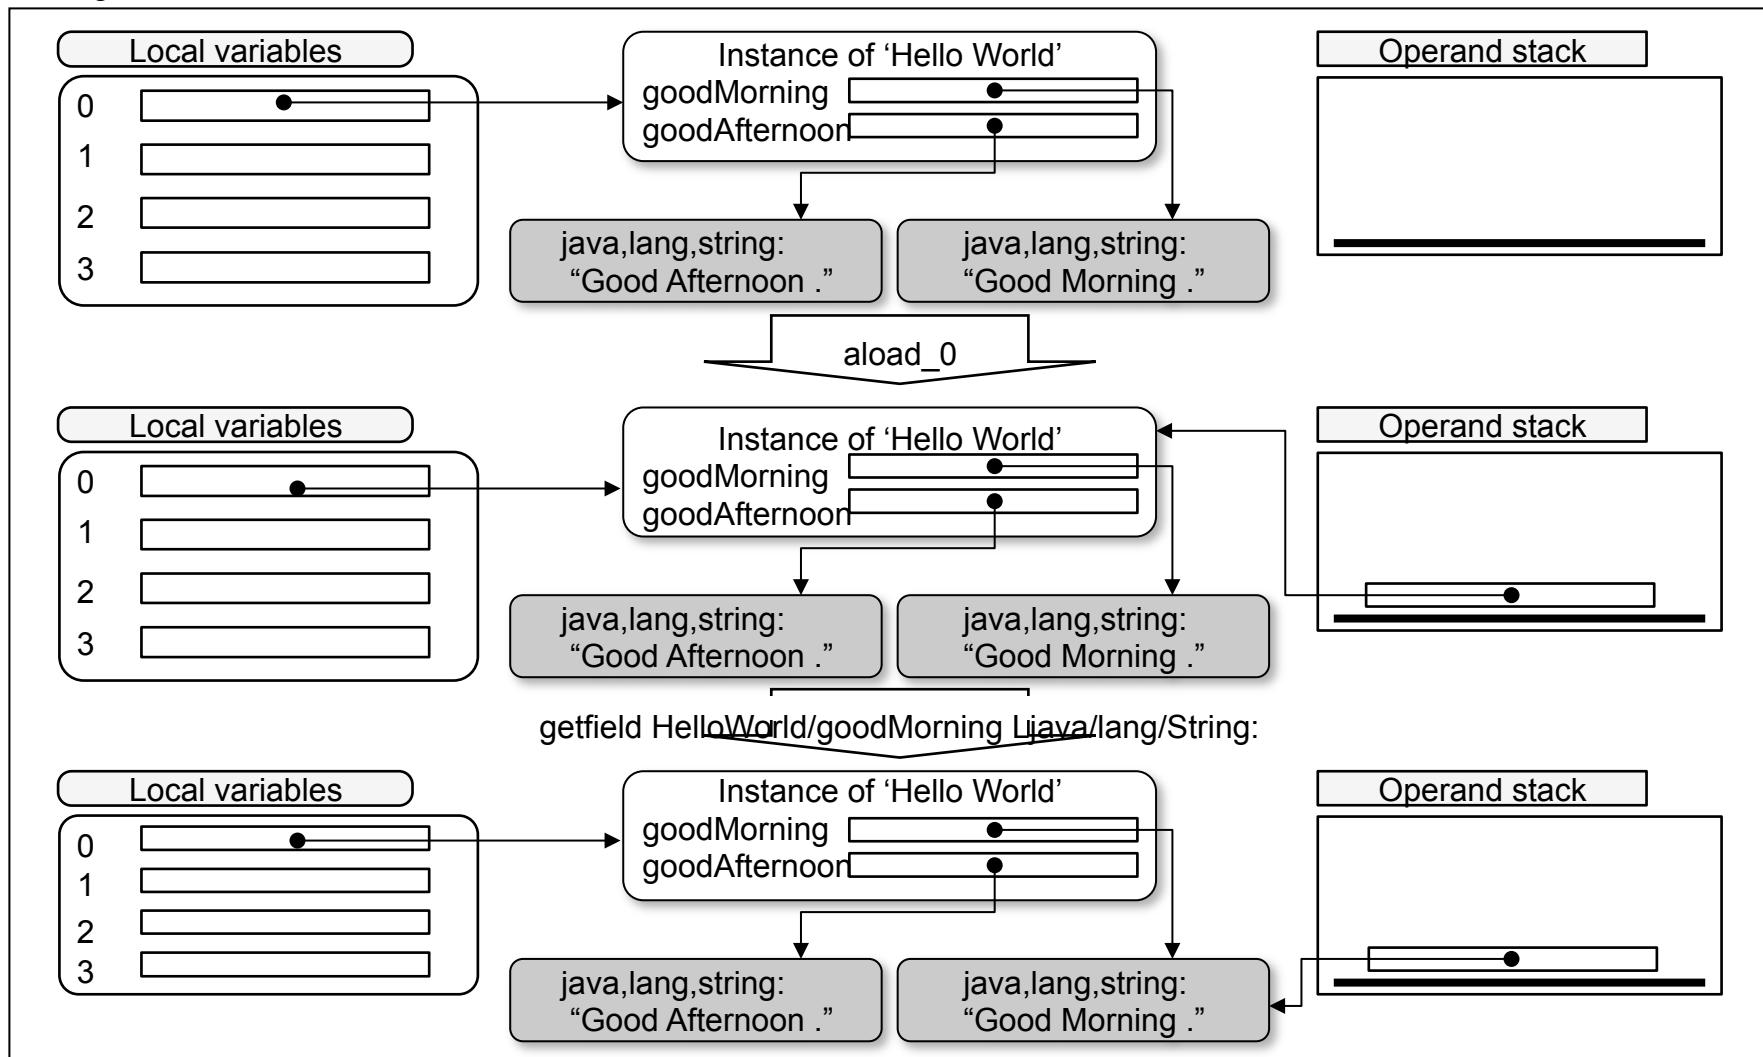

## Access field

`putfield` Set field in object

`putstatic` Set static field in class

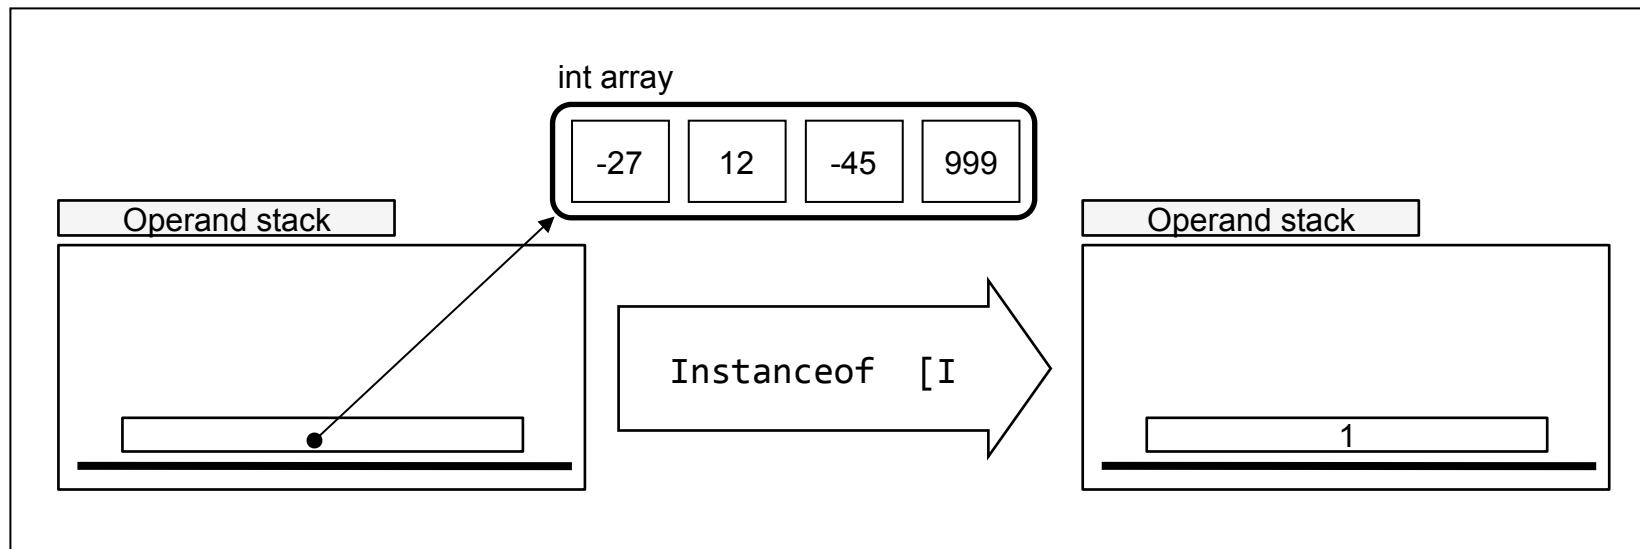

`getfield` Fetch field from object

`getstatic` Get static field from class

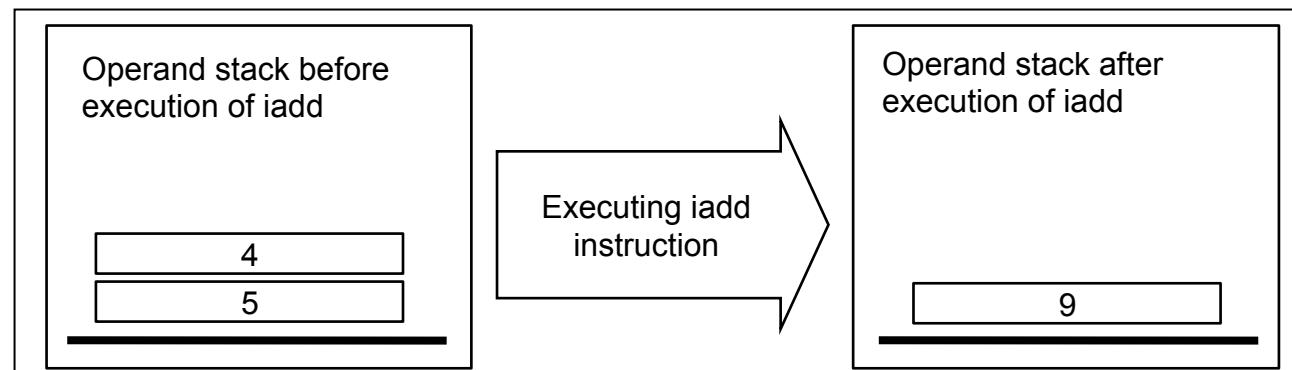

## Type check

- checkcast    Check whether object is of given type  
instanceof    Determine if object is of given type

## Arithmetic & logical operations

iadd	Add int	ishl	Shift left int
ladd	Add long	ishr	Arithmetic shift right int
fadd	Add float	iushr	Logical shift right int
dadd	Add double	iand	Boolean AND int
isub	Subtract int	ior	Boolean OR int
lsub	Subtract long	ixor	Boolean XOR int
fsub	Subtract float	lshl	Shift left long
dsub	Subtract double	lshr	Arithmetic shift right long
imul	Multiply int	lushr	Logical shift right long
lmul	Multiply long	land	Boolean AND long
fmul	Multiply float	lor	Boolean OR long
dmul	Multiply double	lxor	Boolean XOR long
idiv	Divide int		
ldiv	Divide long		
fdiv	Divide float		
ddiv	Divide double		
irem	Remainder int		
lrem	Remainder long		
frem	Remainder float		
Drem	Remainder double		
ineg	Negate int		
lneg	Negate long		
fneg	Negate float		
dneg	Negate double		

## Type conversion

i2d Convert int to double  
i2f Convert int to float  
i2l Convert int to long  
l2d Convert long to double  
l2f Convert long to float  
f2d Convert float to double

f2i Convert float to int  
f2l Convert float to long  
d2f Convert double to float  
d2i Convert double to int  
d2l Convert double to long

i2b Convert int to byte  
i2c Convert int to char  
i2s Convert int to short  
l2i Convert long to int

## Conditional jump & comparison

if<cond>	Branch if int comparison with zero succeeds (<cond> : eq, ne, lt, ge, gt, le)
if_icmp<cond>	Branch if int comparison succeeds (<cond> : eq, ne, lt, ge, gt, le)
if_acmp<cond>	Branch if reference comparison succeeds (<cond> : eq, ne)
ifnonnull	Branch if reference not null
ifnull	Branch if reference is null

lcmp	Compare long, values 1, 0, -1
fcmp<op>	Compare float (<op> : g, l)
dcmp<op>	Compare double (<op> : g, l)

```
class Flow1 {
    int test (int i) {
        if (i < 10)
            return i;
        else
            return 10;
    }
}
```

```
Method int test(int)
0 iload_1
1 bipush 10
3 if_icmpge 8
6 iload_1
7 ireturn
8 bipush 10
10 ireturn
```

0            1            2            3            4            5            6            7            8            9            10

iload	bipush	10	if	0	8	iload	ireturn	bipush	10	ireturn
-------	--------	----	----	---	---	-------	---------	--------	----	---------

## Jump

goto Branch always  
goto\_w Branch always (wide index)

jsr Jump subroutine  
jsr\_w Jump subroutine (wide index)  
ret Return from subroutine

```
int c=10;  
while (c > 0) c--;
```

```
bipush 10  
istore_1  
Loop:  
    iload_1  
    ifle Done  
    iinc 1 -1  
    goto Loop  
Done:
```

## Switch-case

lookupswitch Access jump table by key match and jump  
tableswitch Access jump table by index and jump

```
switch (i) {  
    case 1:  
        return 1;  
    case 10:  
        return 2;  
    case 100:  
        return 3;  
    default:  
        return 0;  
}
```

```
iload_1;  
lookupswitch 3  
    1    : R1  
    10   : R2  
    100  : R3  
    default: R4  
R1:  iconst_1  
     ireturn  
R2:  iconst_2  
     ireturn  
R3:  iconst_3  
     ireturn  
R4:  iconst_0  
     ireturn
```

```
switch (i) {  
    case 1:  
        return 1;  
    case 2:  
        return 2;  
    case 3:  
        return 3;  
    default:  
        return 0;  
}
```

```
iload_1;  
tableswitch 1 to 3  
    R1  
    R2  
    R3  
    default: R4  
R1:  iconst_1  
     ireturn  
R2:  iconst_2  
     ireturn  
R3:  iconst_3  
     ireturn  
R4:  iconst_0  
     ireturn
```

## Method invocation

invokeinterface	Invoke interface method
invokespecial	Invoke instance method; special handling for superclass, private, and instance initialization method invocations
invokestatic	Invoke a class (static) method
invokevirtual	Invoke instance method; dispatch based on class

## Return from method

ireturn	Return int from method
lreturn	Return long from method
freturn	Return float from method
dreturn	Return double from method
areturn	Return reference from method
return	Return void from method

```
class Flow1 {  
    int test (int i) {  
        if (i < 10)  
            return i;  
        else  
            return 10;  
    }  
}
```

```
Method int test(int)  
0 iload_1  
1 bipush 10  
3 if_icmpge 8  
6 iload_1  
7 ireturn  
8 bipush 10  
10 ireturn
```

## Miscellaneous

nop	Do nothing
athrow	Throw exception or error
monitorenter	Enter monitor for object
monitorexit	Exit monitor for object
wide	Declares next instruction uses double-byte local variable index
